

**Table 2.** The distribution of Reinke crystals (RCs) in the patient subgroups depending on the history of cryptorchidism, in comparison to the controls. Data are presented as medians and interquartile ranges.

<b>History of testicular descent</b>	<b>Percentage of counted LCs containing RCs</b>
TDS testes that were cryptorchid at birth	
All (n = 114)	7.4 (2.2-16.1)
Bilateral (n = 76)	6.6 (1.8-15.2)
Unilateral (n = 38)	8.4 (2.9-20.8)
Normally descended TDS testes	
All (n = 88)	3.9 (1.7-9.5)
With a cryptorchid counterpart (n = 38)	3.9 (1.7-9.4)
Without a cryptorchid counterpart (n = 50)	4.0 (1.0-10.0)
Control testes (n = 40)	7.8 (2.0-23.9)
